Click-through Prediction

- Goal : Predicting CTR at Twitter
- Learning-to-rank and Online Learning
- Properties of Tweet streams.
 - ▷ The stream of Tweets are correspond to her long term interest but do not reflect her current status.
 - ▷ Every user has a different timeline which is updated dynamically.
 - ▷ Sparse and Unique property .

2. ADVERTISING IN TWITTER TIMELINE

System overview

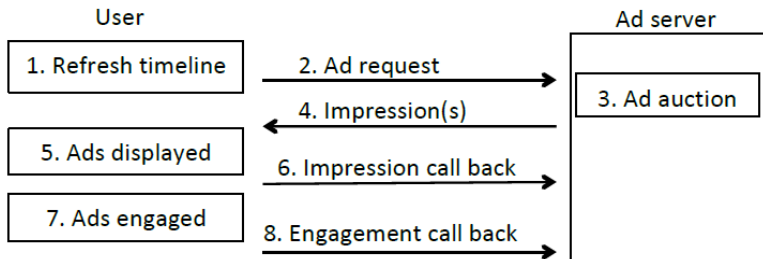

Figure: The process of displaying an ad in Twitter timeline.

- Users could perform a negative engagement with a promoted Tweet by hitting a “dismiss” button.

2. ADVERTISING IN TWITTER TIMELINE

System overview

- An initial set of ad candidates are formed according to the information of the user.
- Auction based on bid price and CTR
- Result : $0 \sim K$ winning ads
- Correct estimation of click probability and good ranking.

Outline

1. INTRODUCTION
2. ADVERTISING IN TWITTER TIMELINE
- 3. METHODS**
4. ONLINE LEARNING INFRASTRUCTURE
5. OFFLINE EXPERIMENT
6. ONLINE EXPERIMENT

3. METHODS

Pointwise approach : Baseline

- $y \in \{\pm 1\}$: ground-truth binary label
- \mathbf{x} : Feature vector from the ad, user, timeline, current session ...
- Minimizing prediction error
- $\mathbf{D} = \{(y, \mathbf{x})\}$: the set of all instances
- Loss for Pointwise learning

$$L(\mathbf{w}, \mathbf{D}) = \sum_{(y, \mathbf{x}) \in \mathbf{D}} l(y, f(\mathbf{w}, \mathbf{x}))$$

- Loss function for a single instance

$$l(y, f(\mathbf{w}, \mathbf{x})) = \log(1 + \exp(-yf(\mathbf{w}, \mathbf{x}))) \quad , f(\mathbf{w}, \mathbf{x}) = \mathbf{w}^T \mathbf{x}$$

- Logistic regression with SGD

3. METHODS

Pairwise approach

- Minimizing ranking loss
- Advantage of user's relative ads preference is that we can address the training data sparsity challenge.
- $\mathbf{P} = \{(y_A, \mathbf{x}_A), (y_B, \mathbf{x}_B) \mid y_A \neq y_B\}$: the set of all pairs in the same session.
- Loss for Pairwise learning

$$L(\mathbf{w}, \mathbf{P}) = \sum_{(y_A, \mathbf{x}_A), (y_B, \mathbf{x}_B) \in \mathbf{P}} l(g(y_A - y_B), f(\mathbf{w}, \mathbf{x}_A) - f(\mathbf{w}, \mathbf{x}_B))$$

- Calibration :
 - Preference score \rightarrow [sigmoid function] \rightarrow click probability

3. METHODS

Combined learning

- Online algorithm based on a combined optimization framework

$$\min_{\mathbf{w}}(\alpha L(\mathbf{w}, \mathbf{D}) + (1 - \alpha)L(\mathbf{w}, \mathbf{P}))$$

- We can change α by varying the weight w_p of instances formed by a pair of ads.

3. METHODS

Pseudo pairs

- If we fail to obtain enough pairs, model would be biased towards minimizing classification loss.
- We artificially create more pairwise training instances.
 - Across-user grouping (CF), Within-user grouping
- Set of all pseudo-pairs

$$\mathbf{S} = \{((y_A, \mathbf{x}_A, t_A), (y_B, \mathbf{x}_B, t_B) \mid y_A \neq y_B, t_A \neq t_B)\}$$

- Loss

$$L(\mathbf{w}, \mathbf{S}) = \sum_{((y_A, \mathbf{x}_A, t_A), (y_B, \mathbf{x}_B, t_B)) \in \mathbf{S}} \max(\min(\log \frac{\mathbf{N}}{|t_A - t_B|}, 1), 0) \cdot l(g(y_A - y_B), f(\mathbf{w}, \mathbf{x}_A) - (\mathbf{w}, \mathbf{x}_B))$$

- Optimization

$$\min_{\mathbf{w}} (\alpha_1 L(\mathbf{w}, \mathbf{D}) + (1 - \alpha_2) L(\mathbf{w}, \mathbf{P}) + (1 - \alpha_1 - \alpha_2) L(\mathbf{w}, \mathbf{S}))$$

5. OFFLINE EXPERIMENT
6. ONLINE EXPERIMENT

4. ONLINE LEARNING INFRASTRUCTURE

Pointwise learning

- Only ads with impression callbacks will be considered as training examples.
- All impressions are always set as negative.
- If ever engagement callback returns, this impression is reset as positive.

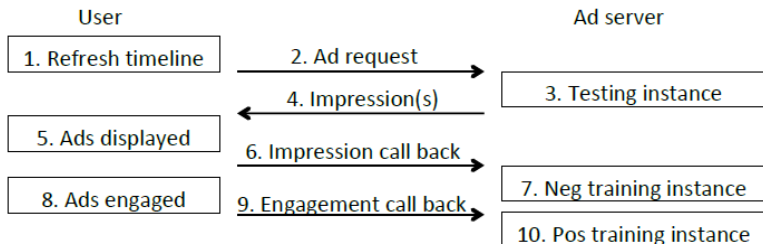

Figure: Online pointwise learning process.

4. ONLINE LEARNING INFRASTRUCTURE

Combined learning

- The positive instance is paired with all negative instances belonging to one session.
- Algorithm : Updated model parameter \mathbf{w} .

```
1:  $imp\_map \leftarrow cache.get(req\_id)$ 
2:  $(y, \mathbf{x}) \leftarrow imp\_map.get(imp\_id)$  // get impression
3: if  $type = impression\_call\_back$  then
4:    $imp\_map.set(imp\_id, (-1, \mathbf{x}))$  // set label to negative
5:   update  $\mathbf{w}$  using  $(-1, \mathbf{x})$  by SGD // pointwise learning
6: else // handle engagement call back
7:    $imp\_map.set(imp\_id, (+1, \mathbf{x}))$  // set label to positive
8:   update  $\mathbf{w}$  using  $(+1, \mathbf{x})$  by SGD // pointwise learning
9:    $P \leftarrow extract\_pairs(imp\_map, (+1, \mathbf{x}))$ 
10:  if  $P.length > 0$  then // pairwise learning
11:    for Each pair  $((y_A, \mathbf{x}_A), (y_B, \mathbf{x}_B))$  in  $P$  do
12:       $\mathbf{x} \leftarrow (\mathbf{x}_A - \mathbf{x}_B)$ 
13:       $y \leftarrow g(y_A - y_B)$ 
14:      update  $\mathbf{w}$  using  $(y, \mathbf{x})$  and weight  $w_p$  by SGD
15:    end for
16:  end if
```

1. INTRODUCTION
2. ADVERTISING IN TWITTER TIMELINE
3. METHODS
4. ONLINE LEARNING INFRASTRUCTURE
- 5. OFFLINE EXPERIMENT**
6. ONLINE EXPERIMENT

5. OFFLINE EXPERIMENT

Metrics

- NRI (Normalized relative information gain) : To quantify the accuracy of predicted click prob.
- AUC (Area under receiver operator curve) : To measure ranking quality

Procedure

- Tweets from random week of year 2014.
- Features : Ad., User, Ad-user interaction, Context of the stream
- Progressive validation
- All parameters are tuned using the first day's data.

5. OFFLINE EXPERIMENT

Experiment Result

- Overall performance (baseline : Pointwise)

Method	Pairwise	Combined	Pseudo
Relative NRI (%)	-75.90	+9.44	+10.25
Relative AUC (%)	+1.76***	+1.91***	+2.11***

Figure: Performance relative to pointwise learning method

5. OFFLINE EXPERIMENT

Experiment Result

- Learning behavior

(a) Relative NRIG

(b) Relative AUC

Figure: Learning behavior of one week excluding the first day

Outline

1. INTRODUCTION
2. ADVERTISING IN TWITTER TIMELINE
3. METHODS
4. ONLINE LEARNING INFRASTRUCTURE
5. OFFLINE EXPERIMENT
6. ONLINE EXPERIMENT

6. ONLINE EXPERIMENT

Metrics

- CTR (click-through rate)
- RPMq (revenue per thousand requests)

Procedure

- Evaluating pointwise learning and combined learning.
- Online A/B tests
- Weaker baseline random-pointwise : baseline

6. ONLINE EXPERIMENT

Experiment Result

- Overall performance

Method	Pointwise	Combined
Relative CTR (%)	+14.59	+26.10(+10.05)
Relative RPMq (%)	+57.20	+57.89(+0.44)

Figure: performance relative to random pointwise

6. ONLINE EXPERIMENT

Experiment Result

- Learning behavior

(a) Relative CTR

(b) Relative RPMq

Figure: Learning behavior

- Combined model is showing fewer ads to users, but these ads lead to higher click-throughs.
- User experience is improved when using combined learning.
