◆□▶ ◆□▶ ★□▶ ★□▶ □ のQ@

Contribution(1)

- Prove a generic uniform convergence guarantee on the generalization error of interpolators.
 - In high-dimensional linear regression with Gaussian data
 - With an arbitrary (Compact) hypothesis class
 - With the class's Gaussian width (and Gaussian radius)
- Norm based generalization bound
 - -> Used to analyze benign overfitting (minimal norm interpolators)

イロト イワト イヨト イヨト ヨー のくで

Contribution(2)

- Applying generic bound to Euclidean norm balls
 - -> Recover consistency result for Barlett et al. (2020) 1
 - -> Confirms a prediction of Zhou et al. (2020)² for near-minimal-norm interpolators (in the case of Gaussian data)
- Applying generic bound to ℓ_1 -norm
 - -> A novel consistency result for minimum $\ell_1\text{-}$ norm interpolators

 $^{{}^{1}}$ "Failures of model-dependent generalization bounds for least-nrom interpolation"

²"On Uniform Convergence and Low Norm Interpolation Learning"

Main results; summary

1. A Generic uniform convergence guarantee

$$\sup_{w \in \mathcal{K}, \tilde{L}(w) = \mathbf{0}} L(w) \leq \frac{1 + \beta}{n} \left[W\left(\Sigma_{2}^{1/2} \mathcal{K}\right) + \left(\mathsf{rad}\left(\Sigma_{2}^{1/2} \mathcal{K}\right) + \left\|w^{*}\right\|_{\Sigma_{2}} \right) \sqrt{2 \log\left(\frac{32}{\delta}\right)} \right]^{2}$$

2. Compact set; General norm ball

$$\sup_{\|w\| \le B, \hat{L}(w)=0} L(w) \le (1+\gamma) \frac{\left(B \cdot \mathbb{E} \left\| \Sigma_2^{1/2} H \right\|_* \right)^2}{n}$$

3. General norm bound with minimum interpolator \hat{w}

$$\|\hat{w}\| \leq \|w^*\| + (1+\epsilon)^{1/2} \sigma rac{\sqrt{n}}{\mathbb{E} \left\| \Sigma_2^{1/2} H
ight\|_*}$$

4. Benign overfitting with general norm (bound $ightarrow \sigma^2$ as $n
ightarrow\infty$)

$$L(\hat{w}) \leq (1+\gamma)(1+\epsilon) \left(\sigma + \|w^*\| \frac{\mathbb{E}\left\|\sum_{j=1}^{1/2} H\right\|_*}{\sqrt{n}}\right)^2$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへ()~

Data Model

Data Model:

$$Y = Xw^* + \xi, \quad X_i \stackrel{iid}{\sim} N(0, \Sigma), \quad \xi \sim N\left(0, \sigma^2 I_n\right)$$

where $X \in \mathbb{R}^{n \times d}$ (i.i.d. , d >> n), w^* is arbitrary, and ξ is Gaussian and $X \perp \xi$.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- Papers results hold for
 - $-X_i$ should be Gaussian
 - ξ can be relaxed to be Sub-Gaussian

Minimum Norm Interpolator

The population loss

$$L(w) = \mathop{\mathbb{E}}_{(x,y)} (y - \langle w, x \rangle)^2 = \sigma^2 + \|w - w^*\|_{\Sigma}^2$$

For an arbitrary norm $\|\cdot\|$, the minimal norm interpolator is defined by

$$\hat{w} = \operatorname{argmin}_{\hat{L}(w)=0} \|w\|$$

◆□▶ ◆□▶ ◆目▶ ◆目▶ 目 のへぐ

Gaussian Width and Gaussian radius

• The Gaussian width of a set $S \subset \mathbb{R}^d$:

$$W(S) := \mathop{\mathbb{E}}_{H \sim N(0, I_d)} \sup_{s \in S} |\langle s, H \rangle|$$

• The radius of a set $S \subset \mathbb{R}^d$:

$$\operatorname{rad}(S) := \sup_{s \in S} \|s\|_2$$

► For
$$\mathcal{K} = \{w : \|w\|_2 \le B\}$$
,
 $- W(\Sigma^{1/2}\mathcal{K}) = B \cdot \mathop{\mathbb{E}}_{H \sim N(0, I_d)} \|\Sigma^{1/2}H\|_2$
 $- \operatorname{rad}(\Sigma^{1/2}\mathcal{K}) = \sup_{\|w\| \le B} \|w\|_{\Sigma}$

Theorem 1, Main generalization bound

 $\exists C_1, C_1 \leq 66$ such that the following is true.

Let \mathcal{K} be an arbitrary compact set, take any covariance splitting $\Sigma = \Sigma_1 \oplus \Sigma_2$, fix $\delta \leq 1/4$ and let $\beta = C_1 \left(\sqrt{\frac{\log(1/\delta)}{n}} + \sqrt{\frac{\operatorname{rank}(\Sigma_1)}{n}} \right)$. If n is large enough that $\beta \leq 1$, then the following holds with probability at least $1 - \delta$:

$$\sup_{w \in \mathcal{K}, \hat{L}(w) = \mathbf{0}} L(w) \leq \frac{1 + \beta}{n} \left[W\left(\Sigma_{\mathbf{2}}^{1/2} \mathcal{K} \right) + \left(\operatorname{rad} \left(\Sigma_{\mathbf{2}}^{1/2} \mathcal{K} \right) + \left\| w^* \right\|_{\Sigma_{\mathbf{2}}} \right) \sqrt{2 \log \left(\frac{32}{\delta} \right)} \right]^2.$$

Effective ranks

• The dual norm of a norm $\|\cdot\|$ on \mathbb{R}^d

$$\|u\|_* := \max_{\|v\|=1} \langle v, u \rangle$$

And the set of all its sub-gradients with respect to u is

$$\partial \|u\|_* = \{\mathbf{v} : \|\mathbf{v}\| = 1, \langle \mathbf{v}, u \rangle = \|u\|_*\}$$

▶ The effective $\|\cdot\|$ -ranks of a covariance matrix Σ are given as follows

$$r_{\|\cdot\|}(\Sigma) = \left(\frac{\mathbb{E}\left\|\Sigma^{1/2}H\right\|_{*}}{\sup_{\|w\|\leq 1}\|w\|_{\Sigma}}\right)^{2} \quad \text{and} \quad R_{\|\cdot\|}(\Sigma) = \left(\frac{\mathbb{E}\left\|\Sigma^{1/2}H\right\|_{*}}{\mathbb{E}\left\|v^{*}\right\|_{\Sigma}}\right)^{2}$$

where $H \sim N(0, I_d)$ and $v^* = \arg \min_{v \in \partial \left\|\Sigma^{1/2} H\right\|_*} \|v\|_{\Sigma}$

General norm

Corollary 3

 $\exists C_1, C_1 \leq 66 \text{ such that the following is true.}$ Take any covariance splitting $\Sigma = \Sigma_1 \oplus \Sigma_2$, let $\|\cdot\|$ be an arbitrary norm, fix $\delta \leq 1/4$ and let $\gamma = C_1\left(\sqrt{\frac{\log(1/\delta)}{r_{\|\cdot\|}(\Sigma_2)}} + \sqrt{\frac{\log(1/\delta)}{n}} + \sqrt{\frac{\operatorname{rank}(\Sigma_1)}{n}}\right)$. If $B \geq \|w^*\|$ and n is large enough that $\gamma \leq 1$, then the following holds with probability at least $1 - \delta$:

$$\sup_{\|w\| \le B, \hat{L}(w)=0} L(w) \le (1+\gamma) \frac{\left(B \cdot \mathbb{E} \left\| \Sigma_2^{1/2} H \right\|_* \right)^2}{n}$$

General norm

Theorem 4

 $\exists C_2, C_2 \leq 64$ such that the following is true.

Take any covariance split $\Sigma = \Sigma_1 \oplus \Sigma_2$, let $\|\cdot\|$ be an arbitrary norm, and fix $\delta \leq 1/4$. Denote P as ℓ_2 orthogonal projection matrix onto the space spanned by Σ_2 and let $H \sim N(0, I_d)$, and let $v^* = \arg \min_{v \in \partial \left\| \Sigma_2^{1/2} H \right\|_*} \|v\|_{\Sigma_2}$. Suppose that there exist $\epsilon_1, \epsilon_2 \geq 0$ such that with probability at least $1 - \delta/4$

$$\begin{split} \|v^*\|_{\Sigma_2} &\leq (1+\epsilon_1) \mathbb{E} \, \|v^*\|_{\Sigma_2} \quad \text{and} \quad \|Pv^*\|^2 \leq 1+\epsilon_2 \\ \text{let } \epsilon &= C_2 \left(\sqrt{\frac{\log(1/\delta)}{r_{\|\cdot\|}(\Sigma_2)}} + \sqrt{\frac{\log(1/\delta)}{n}} + (1+\epsilon_1)^2 \frac{n}{R_{\|\cdot\|}(\Sigma_2)} + \epsilon_2 \right). \\ \text{Then if } n \text{ and the effective ranks are large enough that } \epsilon \leq 1, \text{ with probability} \\ \text{at least } 1-\delta, \text{ it holds that} \end{split}$$

$$\|\hat{w}\| \leq \|w^*\| + (1+\epsilon)^{1/2} \sigma rac{\sqrt{n}}{\mathbb{E} \left\| \Sigma_2^{1/2} H
ight\|_*}$$

Benign overfitting with general norm

Theorem 5

Fix any $\delta \leq 1/2$. let $\|\cdot\|$ be an arbitrary norm and pick a covariance split $\Sigma = \Sigma_1 \oplus \Sigma_2$. Suppose that n and the effective ranks are sufficiently large such that $\gamma, \epsilon \leq 1$ with the same choice of γ and ϵ as in Corollary 3 and Theorem 4. Then, with probability at least $1 - \delta$,

$$L(\hat{w}) \leq (1+\gamma)(1+\epsilon) \left(\sigma + \|w^*\| \frac{\mathbb{E}\left\|\Sigma_2^{1/2}H\right\|_*}{\sqrt{n}}
ight)^2$$

Appendix; Euclidean Norm Ball

$$\blacktriangleright \mathcal{K} = \left\{ w \in \mathbb{R}^d : \|w\|_2 \le B \right\}$$

Corollary 1, Proof of the speculative bound (*) for Gaussian data Fix any $\delta \leq 1/4$. with $B \geq ||w^*||_2$ and $n \gtrsim \log(1/\delta)$, for some $\gamma \lesssim \sqrt[4]{\log(1/\delta)/n}$, it holds with probability at least $1 - \delta$ that $\sup_{||w||_2 \leq B, \hat{L}(w)=0} L(w) \leq (1 + \gamma) \frac{B^2 \operatorname{Tr}(\Sigma)}{n}$

15/20

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 少へ⊙

Theorem 2, Euclidean norm bound; special case of Theorem 4 Fix any $\delta \leq 1/4$. Under the model assumptions in (1) with any choice of covariance splitting $\Sigma = \Sigma_1 \oplus \Sigma_2$, there exists some $\epsilon \lesssim \sqrt{\frac{\log(1/\delta)}{r(\Sigma_2)}} + \sqrt{\frac{\log(1/\delta)}{n}} + \frac{n \log(1/\delta)}{R(\Sigma_2)}$ such that the following is true. If n and the effective ranks are such that $\epsilon \leq 1$ and $R(\Sigma_2) \gtrsim \log(1/\delta)^2$, then with probability at least $1 - \delta$, it holds that

$$\|\hat{w}\|_{2} \leq \|w^{*}\|_{2} + (1+\epsilon)^{1/2} \sigma \sqrt{\frac{n}{\operatorname{Tr}(\Sigma_{2})}}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のへで

Corollary 2

There exists an absolute constant $C_1 \leq 66$ such that the following is true. Pick any split $\Sigma = \Sigma_1 \oplus \Sigma_2$, fix $\delta \leq 1/4$, and let $\gamma = C_1 \left(\sqrt{\frac{\log(1/\delta)}{r(\Sigma_2)}} + \sqrt{\frac{\log(1/\delta)}{n}} + \sqrt{\frac{\operatorname{rank}(\Sigma_1)}{n}} \right)$. If $B \geq ||w^*||_2$ and n is large enough that $\gamma \leq 1$, the following holds with probability at least $1 - \delta$:

$$\sup_{\|w\|_{\mathbf{2}} \leq B, \hat{L}(w) = 0} L(w) \leq (1+\gamma) \frac{B^2 \operatorname{Tr}(\Sigma_2)}{n}$$

Theorem 3, Benign overfitting

Theorem 3 (Benign overfitting). Fix any $\delta \leq 1/2$. With any covariance splitting $\Sigma = \Sigma_1 \oplus \Sigma_2$, let γ and ϵ be as defined in Corollary 2 and Theorem 2. Suppose that n and the effective ranks are such that $R(\Sigma_2) \gtrsim \log(1/\delta)^2$ and $\gamma, \epsilon \leq 1$. Then, with probability at least $1 - \delta$,

$$L(\hat{w}) \leq (1+\gamma)(1+\epsilon) \left(\sigma + \|w^*\|_2 \sqrt{\frac{\operatorname{Tr}(\Sigma_2)}{n}}\right)^2.$$
